

2024

NETWORK GROUP ROADMAP

The Roadmap of Network Group

The Network Group has experienced tremendous growth in the year since its network launch in January 2022. In the last year, our focus has been on ensuring the reliable operation of our services. To meet this goal, we've redeveloped the CCCP relay, incorporating a dependable transaction processing system and a more secure price feed mechanism. Additionally, we've upgraded the CCCP Oracle V2, enhancing its robustness and its ability to manage substantial shifts in the prices of digital assets.

It's time to move past our achievements from 2023 and unveil a fresh roadmap for the next year. In our new roadmap has four phases:

In Phase 0, our focus is on enhancing our existing systems. This sets the stage for Phase 1, where we will secure trendy Web3 core technologies. Starting in Phase 2, we'll further develop these acquired core technologies and establish our leadership in the market. The final phase is centered around maintaining the leadership position we have secured.

BTCFi enables users to stake WBTC (Wrapped Bitcoin) to issue USD tokens, which are then autonomously utilized in various trading strategies to generate profits. This innovative service automates the trading process, leveraging the stability of WBTC and the utility of USD tokens to maximize earnings for users. It offers a hands-off investment experience, combining smart contract technology and finance strategies to optimize returns.

AA (Account Abstraction)

The AA (Account Abstraction) project aims to enhance market competitiveness through several key improvements. A primary focus will be on reducing gas consumption, with plans underway to address this. In the second quarter, we intend to unveil a multi-chain AA, positioning ourselves at the forefront of technological prowess in the market. By the third quarter, an upgrade is planned within the Bifrost Network Layer to facilitate the execution of AA transaction verification logic, aiming to release Super Light AA. This strategy is designed to solidify our technological edge and leadership in the industry.

Bifrost Network

By the second quarter, **the Bifrost Network (Node)** will implement logic updates focused on enhancing stability and security. Additionally, development efforts will be directed towards creating **AA-specific precompile functions, which are crucial for the successful launch of Super Light AA**. These updates are key to ensuring a robust and secure infrastructure, aligning with our commitment to advancing the network's capabilities and maintaining a competitive edge in the industry.

CCCP (Cross-Chain Communication Protocol)

One of our group's key projects, **the CCCP**, is **aiming to release CCCP V2 (General Messaging) on the testnet in the first quarter**. From the second quarter onwards, we plan to deploy CCCP V2 on the mainnet and **develop a cross-chain oracle**. Additionally, **we are progressing towards supporting non-EVM chains, such as Solana**. This plan signifies our commitment to advancing our blockchain technology and ensuring that our network remains at the forefront of innovation and interoperability in the industry.

BNS (Name Service + KYC)

BNS (Blockchain Name Service) is poised to launch the world's first Cross-chain KYC and Name Service. In Q1, we plan to announce the single-chain service, and starting from Q2, development will begin for the Cross-chain BNS. This initiative is a significant step towards leading and maintaining our leadership in web3 technologies. We believe that by expanding our services in this innovative direction, we will be able to offer enhanced utility and interoperability to our users, thereby reinforcing our position at the forefront of the blockchain industry.

Bifrost Smart Wallet

The Bifrost Smart Wallet is an infrastructure technology capable of significantly enhancing the user experience (UX) for DApps that perform cross-chain actions. This small project aims to be implemented in Pocky and Everdex. While it may not be a leading-edge technology, the DApps utilizing it will be able to offer the highest level of user convenience in the web3 space.

Security Engine

The Security Engine is our group's centralized security monitoring engine for all managed projects. Currently, various monitoring systems are fragmented. Our plan is to consolidate these disparate surveillance logics into a single backend server. We will then rebuild application-specific security monitors through the backend server's REST API. We are confident that this project will maintain a high level of security across our initiatives.

Summary

BTCFi enables users to stake WBTC (Wrapped Bitcoin) to issue USD tokens, which are then autonomously utilized in various trading strategies to generate profits. This innovative service automates the trading process, leveraging the stability of WBTC and the utility of USD tokens to maximize earnings for users. It offers a hands-off investment experience, combining smart contract technology and finance strategies to optimize returns.

The AA (Account Abstraction) project aims to enhance market competitiveness through several key improvements. A primary focus will be on reducing gas consumption, with plans underway to address this. Next, we intend to unveil a multi-chain AA, positioning ourselves at the forefront of technological prowess in the market.
